

CR#32

Two consecutive uses of Infant Airtraq in anticipated difficult intubation

Annales Françaises d'Anesthésie et de Réanimation xxx (2010) xxx–xxx

A. Lafrikh, CHU de Bordeaux,, France

We used successfully Airtraq-combined to a gum-elastic boogie to intubate twice a dysmorphic infant with mucopolidosis, in whom direct laryngoscopy failed.

If this result is confirmed by prospective studies, Airtraq could be a first-line device to intubate infants with difficult intubation.
